Dear DataDome Threat Research & Engineering Team,

I am writing to express my strong interest in the AI Engineer position on the Threat Research team at DataDome. Applying generative AI and agentic architectures to bot detection, automated traffic analysis, and SOC triage acceleration aligns directly with my engineering focus as an applied AI builder.

Over the past three years as Lead Developer at FlowSpace.co and as an AI developer delivering client solutions across Europe, I have specialized in building production-grade agent systems and defensive AI workflows:

- **Multi-Agent Workflows & Autonomous Triage:** Architected agent systems leveraging LLMs, multi-agent coordination patterns, and tool use with strict validation schemas. Built human-in-the-loop workflows that ingest multi-format unstructured data streams and escalate low-confidence events to human operators.
- **Defensive AI & Threat Analysis:** Implemented guardrails against prompt injection and data exfiltration across document ingestion pipelines, structuring automated verification and anomaly detection routines.
- **Python & Cloud Infrastructure:** Strong foundations in asynchronous Python services (asyncio), REST APIs, Docker containerization, and cloud deployments on GCP, ensuring high-throughput, low-latency execution.

I bring a passionate builder and hacker spirit, thriving when turning cutting-edge AI research into robust, high-performance production features. I am based in Venice, Italy with European Long-Term Residence (unrestricted EU work authorization) and look forward to contributing to DataDome's mission of protecting the digital ecosystem.

Sincerely,
Prabhavit Gupta
