Dear ID.me hiring team,

I am applying for the Manager, Forward Deployed Engineering role. At FlowSpace and in my freelance consulting, I have spent the last few years operating directly at the intersection of customer needs and technical execution. I specialize in turning ambiguous, in-the-field problems into precise engineering requirements and delivering solutions that scale.

My background combines hands-on engineering with technical leadership and customer-facing project management. Here is how my experience aligns with your needs:

- **Translating customer problems to technical specs:** As a Lead Developer and Technical PM, I regularly acted as the primary bridge between clients and engineering. I mapped out complex data models and integrations (such as Next.js/CRM migrations) to ensure the technical roadmap solved real business gaps.
- **Leading integrations and data pipelines:** I have built and maintained robust LLM-driven data extraction tools, CV parsers, and API integrations that operated reliably against live data, directly improving end-user workflows.
- **Managing technical delivery:** I led the end-to-end migration of a live marketplace that scaled to over 4,500 active users, prioritizing the engineering backlog against competing customer deadlines and urgent business needs.

ID.me's mission to make identity proofing seamless and secure requires a team that can confidently represent technical capabilities to external stakeholders while guiding internal engineering. I excel at building durable relationships with both technical and non-technical partners, ensuring that integrations succeed without friction.

I would welcome the opportunity to discuss how my experience in building platform tools and guiding engineering efforts can support the Forward Deployed Engineering team at ID.me.

I look forward to hearing from you.

Kind regards,

Prabhavit Gupta
