Hiring Team
Bolo AI
Palo Alto, CA (Remote)

Subject: Application for Forward Deployed Product Manager

Dear Hiring Team,

The challenge of making AI reliable in production requires more than just prompt engineering; it demands a deep alignment between technical execution and customer value. Bolo AI's mission to turn successful pilots into must-have deployments resonates strongly with my experience bridging the gap between ambiguous client requirements and scalable product patterns. As an engineer who works closely with stakeholders to ensure deployments actually solve real-world problems, I am excited about the opportunity to join Bolo AI as a Forward Deployed Product Manager.

In my work as a Full-Stack AI & Product Engineer at FlowSpace and as a freelance Project Manager for Urlink, I have consistently operated at the intersection of engineering, product, and commercial outcomes. At FlowSpace, I scoped and deployed AI support agents over live platform data and built GTM automations that directly drove platform growth to over 4,500 users. This required translating customer needs into clear MVP scopes, making technical tradeoffs on API integrations, and ensuring AI workflows delivered measurable ROI.

Having spent my career in fast-paced, high-ambiguity startup environments, I am highly comfortable with fast context switching and navigating without a "perfect playbook." I bring hands-on technical fluency with Python, TypeScript, and LLM orchestration (including Claude and OpenAI APIs), allowing me to reason through implementation constraints and AI workflows directly with engineering teams. At the same time, I know how to distinguish customer-specific requests from reusable product patterns to drive scalable growth.

I am excited about the opportunity to bring my product judgment, technical fluency, and commercial mindset to Bolo AI to help pilots become must-have deployments. I have attached my CV and would welcome the chance to discuss how I can contribute to your team.

Sincerely,

Prabhavit Gupta
