Hiring Team
Braintrust
Remote

Dear Hiring Manager,

When I saw Braintrust's opening for an AI Solutions Delivery Lead / Forward Deployed Engineer, it struck a chord with how I naturally operate: bridging the gap between core engineering and customer success. The FDE model requires someone who can rapidly ship production code, architect robust integrations, and seamlessly context-switch to business conversations with clients. Having spent the last couple of years building and embedding AI solutions into live products, this is exactly the environment where I thrive.

At FlowSpace, I architected and deployed generative AI solutions directly into the platform, serving thousands of users. I built an AI extraction pipeline utilizing TypeScript and Claude that parses unstructured documents to draft marketplace listings, incorporating a human-in-the-loop review system to ensure output reliability. I also shipped autonomous support agents that answer customer queries against live platform databases, with automated confidence-based escalation. Beyond building the core models, I wrote the production integrations connecting our system to third-party tools like OfficeRnD and Nexudus to manage bookings and CRM operations.

My freelance work has further sharpened my ability to operate directly with stakeholders. Whether I was working with UltraStrategy to build backend LLM parsing services or managing client expectations and delivering custom Supabase automations at Urlink, I am used to iterating quickly and delivering solutions that solve immediate business problems. I am highly comfortable across Python, TypeScript, SQL, and the orchestration of LLM APIs, and I regularly use Claude Code to accelerate my development cycles.

Braintrust's mission to improve AI observability and build reliable agentic systems resonates with the challenges I've tackled firsthand. I know how critical it is to trace, test, and evaluate LLM applications before putting them in front of customers. I would love to bring my technical background and client-facing experience to your engineering team to help embed Braintrust's solutions into customer environments.

I look forward to discussing how my skills and background align with your goals for this role.

Sincerely,
Prabhavit Gupta
