Dear Prosper AI hiring team,

When AI leaves a controlled environment and hits a real clinical workflow, the integration is what determines its success. I am an AI Engineer who specializes in bridging that exact gap. My background building and deploying agentic workflows against live data aligns directly with Prosper AI's mission to operationalize voice agents for the healthcare industry as a Forward Deployed Engineer.

In my recent role as Lead Developer at FlowSpace, I took end-to-end ownership of migrating a live marketplace to a modern Next.js and backend stack while developing custom AI solutions. Working directly with complex client requirements, I built robust systems that scale. Here is how my technical and operational experience matches your needs:

- **System Integration:** Designed and deployed a production AI listing bot utilizing Claude and TypeScript to automatically extract data from multi-format brochures into structured JSON.
- **Production Reliability:** Built AI support agents that interact with live platform data, implementing a confidence-based escalation fallback to human operators to ensure high reliability in critical workflows.
- **Client Collaboration:** Acted as a technical project manager on freelance engagements, translating client feedback into direct product improvements and custom integrations.
- **Core Tech Stack:** Highly proficient in building full-stack applications and REST APIs using TypeScript, React, Next.js, and Python, backed by solid database management.

I thrive in high-stakes environments where a "founder mindset" is required to solve the last-mile challenges of deployment. The opportunity to work closely with healthcare clients to integrate your conversational AI into complex EHR systems is exactly the kind of techno-functional challenge I am looking for. I bring the technical rigor to write scalable Python and React code, and the communication skills to debug live systems alongside your customers.

I look forward to discussing how my background in applied AI engineering can support Prosper AI's growth and client success.

Kind regards,

Prabhavit Gupta
