Hiring Team
Audatic / Sonova Group
Berlin, Germany
Role: Software Engineer (m/f/d) - Audatic (Req: 4401339009)

Dear Hiring Team at Audatic and Sonova Group,

I am writing to express my strong interest in the Software Engineer position at Audatic in Berlin. Audatic's pioneering work in training deep learning models to isolate speech in complex acoustic environments (breakthroughs powering technologies like the Phonak Infinio Sphere) transforms everyday human communication. Enabling deep learning engineers and data scientists to rapidly test, evaluate, and deploy sound models requires robust experimentation infrastructure, intuitive internal tooling, and resilient data pipelines. Bridging the gap between machine learning workflows and production software engineering has been the cornerstone of my work over the last three years across European tech companies.

At FlowSpace, I owned developer workflows, internal tooling, and data ingestion architectures. I engineered an automated multi-format ingestion pipeline using Python, TypeScript, and the Claude API, extracting structured data from heterogeneous formats (PDFs, spreadsheets, web documents) with human-in-the-loop verification, successfully processing over 900 entities. To support operations, I developed custom web dashboards in React and TypeScript that gave non-technical operators and engineers complete visibility into pipeline throughput, execution states, and data anomalies. Furthermore, I authored llm-doc-parser, an open-source Python tool implementing schema-enforced validation and deterministic recovery for document ingestion. I am eager to apply this background to develop and scale the experiment control and visualization websites your deep learning engineers rely on.

On the systems and platform side, I focus on building maintainable software that scales reliably. I led the complete architectural migration of FlowSpace's live marketplace off a legacy stack onto a maintainable Next.js and Laravel (PostgreSQL) architecture, scaling active users from 2,000 to over 4,500 with zero downtime. I deployed AI agents querying live operational databases with automated confidence scoring, routing ambiguous edge cases to human specialists. Additionally, I built and maintained bidirectional REST and webhook integrations (OfficeRnD, Nexudus) and automated CI/CD workflows via GitHub Actions and Docker. My priority is always designing clean abstractions, robust API contracts, and comprehensive automated test suites (unit testing, Playwright) that eliminate repetitive manual toil and prevent regressions.

I thrive in collaborative environments where software engineers work in tight synergy with research scientists. Having previously worked with Berlin-based Get2Germany.com, I know the Berlin tech ecosystem well. I hold an Italian European Long Term Residence Permit (granting full, unrestricted work authorization throughout Germany with 0 visa sponsorship required), speak fluent English (C2), and am available immediately. I am fully committed to the hybrid work model at your Berlin office (including an on-site presence of 60% or more) and look forward to contributing directly to Audatic's experimentation platform.

I welcome the opportunity to discuss how my experience in Python, internal developer tooling, API design, and automation infrastructure can accelerate Audatic's engineering goals.

Sincerely,

Prabhavit Gupta
