Dear Nebius hiring team,

I am writing to apply for the Automation Engineer (Customer Service) position at Nebius. With 3+ years of experience building reliable automation pipelines, integrating REST APIs, and developing production LLM agents, I specialize in the exact intersection of backend engineering and customer success this role requires. My background in orchestrating complex, event-driven workflows aligns perfectly with your team's mission to build self-service flows and automate quota request processing at scale.

At FlowSpace, I engineered custom customer support agents utilizing Python and Claude that query live platform data and manage intelligent escalation. This was not a proof of concept. It shipped to production, automating manual workflows and helping teams handle complex customer interactions in real time. Here is how my experience maps to your requirements:

- **Automation & n8n Workflows:** Engineered custom data pipelines and event-driven notifications using Python and n8n, replacing extensive manual engineering work with reliable, automated processes.
- **LLM-Powered Support Agents:** Deployed intelligent AI agents at FlowSpace that integrate directly with live databases, managing nuanced customer inquiries and streamlining ticket resolution.
- **API Integrations:** Architected complex integrations with external billing providers, CRMs, and internal systems, migrating systems to modern architectures and developing robust self-service flows.

I am particularly excited about Nebius because of your commitment to pushing the boundaries of AI cloud infrastructure and open-source models. Building maintainable automation systems that tackle high-priority business challenges as ticket volumes grow is where I thrive, and I am eager to bring my builder's mentality and backend experience to your Customer Service engineering team.

I look forward to hearing from you.

Kind regards,

Prabhavit Gupta
