To: James and the Conversion Team
Role: Forward Deployed Engineer
Company: Conversion

Hi James,

I read your Series A announcement and love the vision for Conversion. As an engineer who has spent the last year turning manual bottlenecks into production AI deployments, the opportunity to replace legacy tools like Marketo and HubSpot with an agentic platform is incredibly exciting. I would love to join as a Founding Forward Deployed Engineer.

In my current role as Lead Developer at FlowSpace, I partner closely with product teams and clients to turn business requirements into deployed technical solutions. One of my key wins was building an AI Listing Bot from scratch: I designed an AI workflow that ingests unstructured customer brochures (PDFs, sites, spreadsheets) and leverages LLMs to push structured data directly into our Laravel backend through a human-in-the-loop review. This directly solved a massive operational bottleneck, which aligns exactly with your goal of translating marketing goals into deployed AI workflows that deliver measurable results.

Furthermore, I am highly experienced in customer integration. I recently led the migration of a legacy stack to a Next.js/Laravel architecture, mapping data structures and routing API cutovers for over 4,500 users. I've also built robust integrations between proprietary platforms and existing CRMs, OfficeRnD, and Nexudus to create automated lead capture and sales routing. I thrive on scoping requirements, building proof-of-concepts, and writing the necessary technical scaffolding to successfully onboard a customer.

While I am currently based in Italy, I am completely open and eager to relocate to San Francisco to work with the team in-person 5 days a week.

I'd welcome the chance to discuss how my experience shipping AI agents into production can help Conversion's enterprise clients thrive.

Best regards,

Prabhavit Gupta
