Motivation letter for Application for Founding Engineer – Berlin, Germany

Dear Hiring Manager,

I am writing to apply for the Founding Engineer role at opus. What made me apply is that the stack you describe is the one I already work in and the customers are industrial, which means the interesting problems are integration and trust rather than novelty. Being early enough to shape both the product and how it gets deployed in front of those customers is the position I want to be in.

Over the past three years, I have successfully transformed abstract business requirements into production-ready features across multiple European technology projects spanning different countries and sectors; from a sports management platform in Luxembourg to strategic consultant platforms in France and Spain.

Operating extensively as a freelance AI Solutions Developer, I engineered AI-based data parsing tools using n8n for UltraStrategy, automated complex workflows for Get2Germany, and executed rigorous quality assurance and API integrations for Clubee.

During my tenure at FlowSpace (based in London), I took over an already built system and managed it until its eventual migration to Next.JS and Laravel. Alongside debugging the system, I also partook in GTM automations using their CRM. I engineered AI agents and automated data parsing tools that directly contributed to scaling the platform from 2,000 to over 4,500 active users.

My daily engineering workflow revolves around the exact requirements outlined in your role: I build in Python and TypeScript with React, I utilize prompt engineering, RAG architectures and agentic orchestration to connect external APIs with foundational models like OpenAI and Anthropic's Claude, and I use AI assistants like Claude Code and Cursor as part of how I work rather than as an experiment. At FlowSpace I inherited a system I had not written, debugged it, and carried it through a migration to Next.JS and Laravel while it went from 2,000 to over 4,500 active users, building the AI agents and automated data parsing behind that growth. To be accurate about the gaps: my Python backend work has not been in FastAPI, Pydantic and SQLAlchemy specifically, and my agentic work has gone through n8n and direct API orchestration rather than PydanticAI, Google ADK or LangGraph. Those are frameworks rather than concepts, and picking them up quickly is most of what my last three years have consisted of. My German is not conversational, which I mention since you note it helps with your industrial customers.

I extensively leverage AI coding assistants like Claude Code and bolt.new alongside low-code platforms and modern frameworks (TypeScript, Next.JS, Laravel, Supabase) to rapidly test hypotheses and deploy MVP architectures. I am also open to learning new systems and tech stacks; I recently completed a course in Microsoft Copilot and AI agent orchestration.

As a graduate of Ca' Foscari University, I have been living in Venice for 5 years, hold a European Long-Term Residence Permit requiring no visa sponsorship, and have the professional English proficiency required for international collaboration. I am also fully available for short and

medium-term business travel as project demands.

I would be glad to talk through how I would approach the first customer deployment and what I would want to learn from it.

Thank you for your time and consideration.

Sincerely,

Prabhavit Gupta
