Application: AI Engineer, Apify

Dear Hiring Team,

I am applying for the AI Engineer role. Building tools that agents can call reliably is the part of LLM work I find most interesting, and I design against the problems you describe, tools the model calls wrongly and agents that confidently do the wrong thing, with confidence thresholds, human review and tests.

At FlowSpace I built support agents with tool use that work against live platform data and escalate to a person on low confidence, and an LLM ingestion pipeline with human review that drafted 900+ listings. I integrated third-party APIs with OAuth and webhooks, tested with Playwright, and led a migration to Next.js and Laravel. I work in TypeScript and Node.js with Claude Code every day and use MCP. My public GitHub, github.com/prab-gupta, includes llm-doc-parser.

On the gaps: I have about three years of professional experience, which is the minimum you ask for. I have not built or maintained a production MCP server, and my quality checks on agents so far are human review and confidence thresholds, not an automated evals pipeline built from production traces. I have not worked with Kubernetes, Terraform or OpenTelemetry, and I have not used Nest.js. I would put real effort into evals, which is the part of the role I would most want to learn.

I am based in Venice, hold a European Long Term Residence Permit (no sponsorship needed in the EU), and am available immediately. I am happy to work fully remotely, and I am open to relocating to Prague. Thank you for considering my application.

Kind regards,
Prabhavit Gupta
