Dear ABB hiring team,

I am applying for the GenAI/LLM Application Developer role in Ostrava. I build production-oriented AI applications and integrations, combining LLM and RAG workflows with practical backend, API, data, and product engineering.

At FlowSpace, I built and operated AI features for a live marketplace. A multi-format ingestion pipeline processes PDFs, web pages, photos, and spreadsheets, extracts structured data with LLM APIs, validates the result through human review, and sends approved records to the platform backend. It has produced more than 900 draft listings. I also built support agents grounded in live platform data with confidence-based escalation, and delivered REST integrations with booking and CRM systems. These projects required attention to failure modes, non-deterministic outputs, validation, and maintainable delivery rather than demos alone.

My documented production stack includes TypeScript, Laravel, APIs, n8n, Supabase, and LLM/RAG workflows. Python is an active learning area relevant to AI engineering work, and I am building familiarity with the surrounding tooling used for containerized, data-backed applications. I am comfortable translating a use case into an API-backed application, connecting model output to structured data, and testing the path from input to user-facing result. ABB's focus on practical GenAI and LLM applications is a strong match for my applied, product-minded approach.

I am based in Venice, Italy, hold an EU Long Term Residence Permit, and am available immediately. I am open to relocating to Ostrava and would welcome the opportunity to discuss how I could contribute to ABB's application development work.

Regards,
Prabhavit Gupta
