Dear AG Solution Group hiring team,

I am applying for the Global OT Application Engineer role. I am an application and integration engineer who configures, tests, and supports production systems end to end, and I want to bring that discipline into the OT/MES space.

At FlowSpace, I built and operated OfficeRnD and Nexudus API integrations that sync booking data into a live operator platform, working with REST endpoints, webhooks, and SQL. I built and ran an LLM-based data pipeline that ingests documents in multiple formats, validates the extracted data, and writes approved records into the production backend, now over 900 records processed. I write Python and TypeScript for this integration work, use Playwright for functional and regression testing, and have supported production systems directly, including triaging incidents and escalating appropriately.

Industrial OT and MES platforms are new to me specifically, but the underlying work, being the technical bridge between systems, translating requirements into tested interfaces, and supporting sites after go-live, is what I already do. I learn new systems quickly and would welcome applying that here.

I am based in Venice, Italy, hold an EU Long Term Residence Permit, and am open to remote work or relocating to Barcelona.

Regards,
Prabhavit Gupta
