Dear ActAI team,

I am applying for the Applied AI Engineer role in Ireland.

Turning model capabilities into product behaviour that works for real users, not just in demos, is what I have done for two years at FlowSpace (coworking marketplace, London). I designed and iterated the prompts, tools and memory behind the LLM pipeline that turns any operator brochure (PDF, website, photo, spreadsheet) into a validated listing after human review, 900+ listings so far, and behind the RAG support agents that answer from live data and escalate to a person when confidence is low. I built lightweight evaluation loops on real inputs and debugged issues across model, orchestration, infrastructure and UX. My documented production stack centers on TypeScript, Laravel, Next.js migration and oversight, REST and external API integrations, n8n, Supabase, and LLM and RAG workflows. Claude Code is my primary development tool. Python is an active learning area rather than an established day-to-day production language.

I want to be direct about the gap: my hands-on model work has been prompting, retrieval, structured outputs, human review and evaluation over hosted and open-source LLMs, not model training in PyTorch or JAX. I have shipped the systems-and-product side of applied AI, including reliable multi-step behaviour and measurable improvement on real inputs; where the role needs deeper ML engineering, I am actively learning and would say so early.

Logistics: I am based in Venice, Italy, hold an Italian EU Long Term Residence Permit, and am ready to relocate to Ireland. The applicable Irish employer-side work authorization and sponsorship process would be needed, and I am ready to complete it. English is my professional working language. Available immediately.

A runnable sample of how I build: github.com/prab-gupta/llm-doc-parser. CV attached.

Regards,
Prabhavit Gupta
