Dear Amusnet team,

I am applying for the Automation QA Engineer role in Sofia. Your posting asks for someone with 2+ years in test automation, solid OOP and design-pattern habits, and ideally Playwright with TypeScript, API testing and Docker. That is the toolset I use every week.

At FlowSpace, a London coworking marketplace, I wrote Playwright end-to-end and API tests in TypeScript for a Next.js and Laravel product while it stayed live through a full stack migration, ran manual edge-case testing before each release, and wired the suites into GitHub Actions so regressions were caught before merge. I also built an AI listing pipeline whose output is gated by validation rules and human review before it reaches the database, which taught me to think about test oracles for non-deterministic systems. Earlier, at Clubee, I ran unit testing and QA across a sports-club platform's frontend and API integrations.

Gaming platforms live or die on reliability across 2,000+ integrations, and I like the discipline that demands: clear test plans from the requirements, maintainable frameworks, and honest reporting of what the automation does and does not cover.

I hold an EU long-term residence permit (Italy), am available immediately, and would relocate to Sofia; the Bulgarian work permit is an employer-side step I am glad to walk through with you.

Regards,
Prabhavit Gupta
