Dear Hiring Team,

I am applying for the AI Engineer role at Axians Portugal. Maintaining and evolving a portfolio of production AI agents for back-office financial operations is the part of AI engineering I have actually lived in: not the demo, but the months after it, when reasoning flows, tool calls, prompts and evaluations have to keep working.

At FlowSpace I built and operated an agentic document pipeline in Python and TypeScript that takes brochures in any format, runs multi-step extraction with tool calling, structured outputs and retrieval, and pushes validated records to the backend after a human review step. It processed 900+ records while the platform grew from 2,000 to 4,500+ users. I also built RAG-backed support agents that answer against live data and escalate on low confidence, and most of the ongoing work was reliability: handling partial API failures, stopping the agent from answering what it could not verify, and evaluating every prompt change against real transcripts before shipping it.

Your stack maps closely to that work: Python agent development, prompt and configuration engineering, evaluation frameworks and regression suites, REST integrations, and close collaboration with business stakeholders. I have working knowledge of Docker and Kubernetes deployments and of LangChain, and I ramp quickly on frameworks such as LangGraph because the underlying patterns (task decomposition, memory, guardrails, human-in-the-loop) are the ones I already build by hand.

I am based in Venice, Italy, hold an EU Long Term Residence Permit so no sponsorship is needed in Portugal, and I am open to relocating to Porto. Advanced English, available immediately.

Regards,
Prabhavit Gupta
