Dear Hiring Manager,

I am applying for the Experienced Software Test Engineer, Analytics Test role in Lund. At FlowSpace, a workspace marketplace, I have spent the last three years owning quality across a live product. Before that, at Clubee, I ran unit testing and QA on new features as part of my role. At FlowSpace I built and maintained test automation with Playwright alongside the wider engineering work, and I built and operate an AI listing pipeline that extracts structured data from unstructured brochures and drafts full listings, with a human reviewer checking every output before it goes live. I also built a support AI agent that answers customer queries against live platform data and escalates to a person whenever its confidence is low. That work gave me a direct feel for the shift your posting describes, validating a system whose output is probabilistic rather than deterministic, and designing checks that catch what a traditional regression suite would miss.

My day to day stack is Python, TypeScript and Node.js, with third-party API integrations, REST APIs, and GitHub for version control throughout. I am comfortable moving between manual exploration of a new feature and writing the automated coverage that keeps it working.

I am based in Venice, Italy, and hold Italian EU long-term resident status. I am not currently authorised to work in Sweden and would need the employer-side permit process, which I am ready to start immediately. I am ready to relocate to Lund.

Regards,
Prabhavit Gupta
