Dear Hiring Manager,

I am applying for the Forward Deployed AI Engineer role with BCG X in Stockholm. I am motivated by work that combines practical AI engineering, close collaboration with clients, and the responsibility of turning ambiguous problems into reliable software.

As Lead Developer at FlowSpace, I have helped scale a product from 2,000 to more than 4,500 users while owning product delivery, integrations, and communication across internal and external teams. I have built LLM-driven data-processing tools that ingest documents and web sources, extract structured information, and route results through human review. I have also built RAG-backed support agents with confidence scoring and escalation, and integrated external booking and CRM systems through APIs. This work has required me to move from problem framing through implementation, testing, iteration, and production support.

BCG X's forward-deployed model is a strong fit for how I work: I enjoy translating business needs into clear technical solutions, explaining trade-offs to non-technical stakeholders, and iterating quickly with users. My current development work is centered on TypeScript, Laravel, Next.js, API integration, Playwright, and AI-assisted engineering. I have not represented Python as a primary production language, but I am actively building my software engineering depth and would bring strong practical experience with AI applications, RAG workflows, data processing, and client-facing delivery to the role.

I am based in Venice, Italy, hold an EU Long Term Residence Permit, and am open to relocating to Stockholm. I would welcome the opportunity to discuss the role's work authorization requirements and how I could contribute to BCG X's client engagements.

Regards,
Prabhavit Gupta
