Dear BlockTech team,

I am applying for the Quantitative Developer role in Amsterdam. I should be upfront: I am not a quant researcher, I am a product engineer who builds the infrastructure that takes something from a rough idea to a reliable production system, which is what this role is actually asking for underneath the title.

At FlowSpace I built the AI listing pipeline, a data pipeline that takes unstructured input, a brochure, a website, a spreadsheet, and turns it into over 900 validated production records, with a check for when output needs a human rather than going live blind. I also own the Playwright end-to-end test suite across a Next.js and Laravel platform, so shipping code that keeps working once it is live, not just once in a demo, is the daily job.

The short distance between a good idea and live results is exactly the environment I want to be building infrastructure for next.

Logistics: I hold an Italian EU long-term residence permit. I am not yet authorised to work in the Netherlands and would need an employer-side TWV permit, which I am ready to start alongside relocating. English is fluent, available immediately.

Regards,
Prabhavit Gupta
