Dear Bloom / Aleta team,

I want to work where AI writes the code and the job is knowing whether it is right. At FlowSpace, I owned a Next.js, Laravel and Supabase platform in production, through a live migration off a legacy stack. I built an LLM pipeline that drafted more than 900 workspace listings with a human review step, and OfficeRnD and Nexudus integrations that power real bookings. When those booking flows broke, I was the one reading logs and traces to find out why. Claude Code is my daily driver for shipping and reviewing AI generated code, so I recognise the failure mode Aleta is hiring against, output that looks plausible and is subtly wrong.

A small team with real ownership and rules written as files in the repo is close to how I already work. Wealth data that must be right by morning is a sharper version of the nightly booking problem I already own.

I am based in Venice, Italy, ready to relocate to Aarhus. I hold Italian EU long-term resident status, which does not cover Denmark, so I would need an employer-side permit and am ready to start that process.

Regards,
Prabhavit Gupta
