Dear Cognizant hiring team,

I am applying for the DevOps & Automation Engineer role on the GE ADMS Series 6 program. I have three years of professional experience building and running automation tooling in production, close to the "approximately two years of solid hands on experience" the posting says it welcomes.

At FlowSpace, I lead the engineering side of a live workspace marketplace. I built and run the automation layer end to end: n8n workflows for CRM and GTM tasks (lead capture, enrichment, routing, outbound), OfficeRnD and Nexudus API integrations for automated bookings, and a Python and TypeScript based AI tool that processes and scrapes data to keep listings current, all versioned and reviewed through GitHub. I also drove the automated migration of the platform off a legacy stack onto Next.js and Laravel: I mapped the old data structure to the new one, moved each entity through the automation path that fit it (API endpoints or CSV exports), and ran the cutover while the product stayed live, growing the user base from 2,000 to 4,500 plus.

At Get2Germany, I built AI based automation tools with n8n integrated against Google APIs to surface courses, internships and jobs, and optimised the underlying database. Across both roles the pattern is the same: turn a manual, error prone process into a scripted, repeatable pipeline.

I want to be direct about the gap: I have not used Jenkins, Terraform or Ansible in production. What I bring is solid CI/CD fundamentals, daily GitHub workflow discipline (branching, pull requests, code review), and Python scripting for automation and tooling, plus a track record of picking up new infrastructure quickly across eight companies in three years. I would expect to be productive with your Jenkins pipelines and Terraform modules within the ramp up period.

I hold Italian EU long-term resident status. I am not currently authorised to work in Sweden and would need the applicable employer-side permit or sponsorship process. I am ready to relocate and complete that process.

I would welcome the chance to bring this automation background to a program building critical grid infrastructure at this scale.

Regards,
Prabhavit Gupta
