Dear Hiring Manager,

I am applying for the QA Automation Engineer role at DKB Code Factory in Valencia. The opportunity to act as a quality advocate within a collaborative, learning-first engineering team strongly matches how I have worked across product development and automation projects.

At FlowSpace, I build and validate production features while coordinating product logic, integrations, and delivery with internal and external developers. My hands-on toolkit includes Playwright for browser automation, Postman for API validation, Jira and GitHub for delivery workflows, and TypeScript and Laravel for application work. Earlier, at Clubee, I performed unit testing and quality assurance for new features and integrated the platform's API across the frontend. These experiences taught me to clarify requirements early, test realistic scenarios, investigate failures, and communicate risks before release.

I can contribute a practical foundation for backend and API-focused automation, test data and environment thinking, and cross-functional quality discussions. My primary programming experience is in TypeScript and Laravel rather than Java or Kotlin, but I am comfortable learning comparable technologies and extending automation coverage across testing levels. I would be especially motivated to grow into DKB's testing practices, including integration and end-to-end validation, root-cause analysis, and continuous testing in an agile environment.

I am based in Venice, Italy, hold an Italian EU Long Term Residence Permit, and am open to relocating to Valencia. I understand that work authorization and any sponsorship process for Spain would need to be assessed by DKB Code Factory, and I am ready to complete the applicable employer-side process. I speak English professionally and would welcome the opportunity to discuss how I can help DKB Code Factory deliver reliable software with confidence.

Regards,
Prabhavit Gupta
