Dear Stardex hiring team,

I am applying for the Forward Deploy Engineer (FDE) role. Owning a customer's data migration end to end, with zero margin for error, is exactly what I have been doing at FlowSpace for the last two and a half years.

I took over a live workspace marketplace and drove its migration off a legacy stack onto Next.js and Laravel while the product stayed live and users kept booking. I mapped the old data structure to the new one entity by entity, chose the migration path per entity (API endpoints or CSV export), and ran the cutover so nothing broke for the 2,000 to 4,500+ users on the platform. I also built and own an AI listing bot, in TypeScript, that reads a provider's brochure in any format and drafts a structured listing with a human in the loop before it reaches the backend, which is the same instinct Stardex is asking for: reach for AI to automate the repetitive part of getting messy data into a clean system.

At Get2Germany I integrated Google APIs into the platform and optimised the underlying database, and built AI tools that search courses, internships and jobs against those APIs, using n8n for the automation layer. That is the same shape of work as extending a product via its API to fit a customer's workflow, which is a core part of what you are describing for this role.

I write TypeScript daily in production, I am comfortable with SQL for transforming and cleaning relational data, and I use Claude Code as a normal part of how I automate repetitive migration and QA work rather than doing it by hand. I hold Italian EU long-term resident status, which authorises me to work from Italy now with no sponsorship needed; if this role sits in Portugal specifically, I would need that country's applicable permit or sponsorship process, which I am ready to start, and I am equally open to doing the role remotely from Italy.

I would welcome the chance to talk through how I would approach being your first Forward Deployed Engineer.

Regards,
Prabhavit Gupta
