Dear Hiring Manager,

I am applying for the Manual/Auto QA Engineer role at Drum'N'Code. I have spent the last two and a half years testing and shipping features on a live product, and QA has been a constant thread through that work, so a role built specifically around it is a natural next step.

At FlowSpace I wrote and maintained Playwright end-to-end and API tests against a live marketplace, ran API testing with Postman across integrations with OfficeRnD and Nexudus, and used SQL against a Supabase/PostgreSQL database to validate booking and listing data. I built validation checks into an AI listing pipeline that has produced over 900 draft listings, and I evaluated RAG-based support agents for response quality and hallucinations before they reached customers. I work daily in Git and am comfortable wiring tests into CI/CD pipelines.

My hands-on automation tool is Playwright rather than Cypress, but the two share the same testing model and I pick up new frameworks quickly.

I am based in Venice, Italy, authorised to work here, and would perform this role remotely from Italy.

Regards,
Prabhavit Gupta
