Dear GlobalLogic team,

I am writing to apply for the Forward-Deployed AI Product Architect role (IRC302350). I have three years of experience, short of the fifteen you list, but the work I have shipped sits exactly at the intersection this role names: product engineering, AI orchestration and embedded client delivery.

At UltraStrategy, I built a CV-parsing pipeline that a client platform uses end to end: a user uploads a CV, the pipeline extracts the data and scores how relevant that person is for specific role types, the result is delivered to the frontend, and the pipeline then generates a standardised "Ultra CV". I used Affinda and the Claude API for parsing and generation, orchestrated in n8n with Eden AI for the extraction layer, and I also built the platform that serves the different user profiles. That is a domain-specific, intent-driven AI workflow built and owned by one person.

At FlowSpace, a workspace marketplace, I took over a live product and bridged it from a legacy stack onto Next.js and Laravel: mapping the old structure to the new one, choosing the migration path per entity, and driving the cutover while the platform stayed live and grew from 2,000 to 4,500 plus users. On top of that I built an AI listing bot that turns a brochure in any format into a drafted listing with a human in the loop, and support agents that answer customer queries from live data and escalate to a human on low confidence, both running in production with real users.

I use Claude Code daily and I am comfortable being the embedded technical voice in a client engineering team, writing code, evaluating architecture and reporting outcomes upward. I would welcome the chance to discuss how I could contribute to GlobalLogic's client delivery.

Regards,
Prabhavit Gupta
