Dear Hiring Manager,

I am applying for the Agentic AI Engineer role for Entune. Building software that turns raw building data into autonomous, reliable decisions is the exact intersection I have been working in: agentic AI on top of solid backend engineering, not AI in isolation.

At FlowSpace, I built an LLM extraction pipeline that processes brochures, PDFs, websites and spreadsheets in any format and drafts structured records, with validation and human review before anything reaches production, now covering over 900 listings. I also built RAG-backed support agents that answer against live platform data, escalate to a human on low confidence, and get evaluated and iterated rather than shipped and forgotten. Alongside that I shipped OfficeRnD and Nexudus integrations for automated bookings, close in shape to the building and sensor integrations Entune runs on. My stack is Python and TypeScript, with Supabase and PostgreSQL underneath.

Entune's mix of AI engineering, cloud infrastructure and IoT data is the full-stack-plus-AI role I want next. I am based in Venice, Italy, hold Italian EU long-term residence, and am ready to relocate to Iasi. I understand that needs Itility's employer-side work permit process, and I am glad to start it.

Regards,
Prabhavit Gupta
