Dear Kyndryl Hiring Team,

I am writing to apply for the Senior Forward Deployed Engineer role in Milan.

At FlowSpace, I took over a live workspace marketplace and automated its data migration off a legacy stack onto Next.js and Laravel, mapping the old structure to the new one, choosing the migration path per entity, and driving the cutover while the product stayed live, growing the platform from 2,000 to over 4,500 users. I also built and own an AI listing bot, brochure to structured listing with a human in the loop, over 900 drafts produced, and support AI agents that answer from live platform data and escalate to a person on low confidence, the same generative and agentic AI pattern your posting describes integrating into enterprise workflows. I built these with the Claude API, n8n and TypeScript, and connected them to real systems through OfficeRnD and Nexudus API integrations.

At UltraStrategy, I built the CV-parsing pipeline behind the platform: a user uploads a CV, the pipeline extracts the data with Affinda, scores how relevant that candidate is for specific role types with the Claude API, the result is delivered to the frontend, and a standardised Ultra CV is generated, orchestrated with n8n and Eden AI. That project is the closest match to the model lifecycle and orchestration work your posting asks for, taking an AI pipeline from prototype to something the platform depends on daily.

I want to be direct about fit. I have three years of professional experience across eight European companies, not the level a Senior data-architecture title usually implies, and I have not run AI workloads on AWS, Azure or GCP at enterprise scale. What I bring is hands-on delivery of generative and agentic AI features into a live, customer-facing product, end to end, from data pipeline to production.

I hold Italian EU long-term resident status and am authorised to work in Italy without sponsorship. I am based in Venice and ready to work from Milan.

Regards,
Prabhavit Gupta
