Dear Hiring Manager,

I am applying for the Front-End Software Engineer role on the BrickLink Catalog team.

BrickLink's catalog is the reference tool a large community of builders, collectors and sellers relies on to identify and manage parts and sets, and re-platforming it onto React and Next.js while keeping that community's trust is the kind of frontend problem I want to work on.

At FlowSpace I built and shipped production frontend features in Next.js and TypeScript end to end, including the UI for an AI-assisted listing pipeline that has produced 900+ draft listings for human review. I wrote Playwright end-to-end tests to keep that pipeline reliable as it grew, and integrated OfficeRnD and Nexudus APIs into the booking flow. That mix, component-driven frontend work backed by real test coverage and real third-party integrations, maps closely onto what this role asks for.

I am based in Venice, Italy, and ready to relocate to Billund. I hold Italian EU long-term resident status, which does not extend automatically to Denmark, so I would need the LEGO Group's employer-side permit process, and I am ready to complete it.

Regards,
Prabhavit Gupta
