Dear MPower Plus hiring team,

I am applying for the Test Automation Specialist role in Livorno. I have three years of professional experience across full stack and QA work, with Python as one of my working languages, and I am comfortable travelling to Livorno for the on-site days.

At Clubee I integrated the Clubee API across the frontend and ran unit testing and quality assurance on every new feature before release, alongside building shop, domain-integration and federation-dashboard tools, so testing was part of my day to day rather than a separate step bolted on at the end.

At FlowSpace I use Playwright as part of the role-level toolset for testing the platform, and I built an AI tool that processes and scrapes data from brochures in any format to draft structured listings, which is the same kind of post-processing and reporting work described in this role, going from raw source data to a usable, reviewed output.

I am authorised to work in Italy without sponsorship and can be in Livorno for the required on-site days each week.

I would welcome the chance to talk through how I would approach the Python framework restructure and the reporting tooling for this role.

Regards,
Prabhavit Gupta
