Dear Malwarebytes team,

I am writing to apply for the MDR Platform Engineer (Remote, Italy) role with ThreatDown. I want to be upfront: I do not have a background in security operations, and I have not worked with SIEM or SOAR implementations directly. What I bring is three years of building AI implementations and API integrations for production platforms, a working proficiency in Python for pipelines and automation, and a habit of debugging live systems end to end.

At UltraStrategy, I built a CV parsing pipeline integrated into the platform: a user uploads a CV, the pipeline extracts the data with Affinda and the Claude API, assesses how relevant the candidate is for specific role types, and delivers the result to the frontend before generating a standardised "Ultra CV". The pipeline was assembled with n8n and Eden AI, which is where I learned to design and test a multi-step data pipeline end to end, the same discipline SIEM rule and SOAR playbook development would ask for.

At FlowSpace, a live workspace marketplace, I integrated the OfficeRnD and Nexudus APIs for automated bookings and built an AI tool that turns broker material in any format into structured platform listings, with a human reviewer in the loop before anything ships. Production debugging was constant in that role, tracing data mismatches back to source whenever an integration broke.

At Get2Germany, I integrated Google APIs and built AI tools that search for courses, internships and jobs, while optimising the underlying database.

I learn new tools quickly and am confident I could pick up SIEM and SOAR specifics fast given this base. I am based in Venice, authorised to work in Italy without sponsorship, and available to start within two weeks of an offer. I would welcome the chance to discuss how I could contribute.

Kind regards,
Prabhavit Gupta
