Dear Mendix Hiring Team,

I am writing to apply for the Junior Software Developer role. Over the past three years I have worked across several European teams building production features in TypeScript, and I am drawn to Mendix because it sits at the same line I already work on: making complex logic usable by people who did not write the code.

At FlowSpace, I worked in TypeScript and Laravel to take over a live workspace marketplace and automate its migration off a legacy stack, mapping the old data structure to the new one entity by entity and cutting over while the product stayed live, growing from 2,000 to 4,500+ users. I contributed across the full development lifecycle: building features, integrating external APIs such as OfficeRnD and Nexudus, and testing and debugging as the platform kept changing under real users.

At Urlink, I built the platform and its core logic using AI-assisted development, working directly with the client to turn their requirements into working automations, with Next.js and Supabase as the stack. That role is the closest match to what this posting asks for: comfort with AI-assisted development tools and turning ambiguous requirements into a shipped solution quickly.

I hold Italian EU long-term resident status. I am not currently authorised to work in the Netherlands and would need the applicable employer-side work permit process; I am ready to relocate to Rotterdam and complete that process.

I would welcome the chance to discuss how I could contribute to the Mendix team.

Regards,
Prabhavit Gupta
