Dear Minerva Imaging Hiring Team,

I am writing to apply for the Junior Python Developer role. I have three years of professional experience across backend development, database work and API integrations, and I am keen to grow further in Python and Django alongside your development team.

At FlowSpace, a workspace marketplace, I worked as lead developer on a live product, mapping a legacy data structure entity by entity and migrating it onto Next.js and Laravel through API endpoints and CSV exports while the platform stayed live for its users, growing usage from 2,000 to 4,500 plus. That work meant maintaining and extending an internal application relied on daily by real users, which is close to the core application your team builds around.

At Get2Germany, I integrated Google APIs to track platform activity, optimised the underlying database, and built automation tools with n8n that help people find courses, internships and jobs. That combination of API work and database optimisation is the closest match to the smaller, clearly defined backend tasks described for this role.

My working stack includes Python, and I have working knowledge of Django. I use AI-assisted development tools such as the Claude API and Claude Code in a structured way, and I am comfortable asking questions, taking feedback and working both independently and as part of a team. I hold Italian EU long-term resident status; for a role based in Denmark I would need the applicable national employment permit, and I am ready to relocate and complete that process for the on-site role in Olstykke.

Regards,
Prabhavit Gupta
