Dear Parallel team,

I am writing to apply for the Field Deployment Engineer role. I have three years of experience being the technical interface between a live product and the people who actually use it, taking a platform on the ground, adapting it to a client's real constraints, and staying accountable when something breaks in front of them.

At FlowSpace, I took over a live workspace marketplace and drove its data migration off a legacy stack onto Next.js and Laravel while the product stayed live, mapping the old structure to the new one and choosing the migration path per entity. The platform grew from 2,000 to 4,500+ users through that period. I also built and own an AI listing bot that turns a brochure in any format into a drafted listing with a human in the loop, and support AI agents that answer customer queries from live data and escalate to a person when confidence is low, which is the same judgment call your agents need to make on the ground in a hospital workflow.

At Urlink, I worked as project manager and AI-assisted developer at the same time, building the platform and its logic and implementing automations driven directly by client requirements, using Next.js, Supabase and Netlify. That role was about translating what a client actually needed into a working system fast, which is close to what facility-level deployment work asks for.

I do not have healthcare or RPA-specific experience, and I am stating that plainly rather than stretching my background to fit. What I do have is a track record of being the person who gets hands-on with the product, adapts it to a specific environment, and unblocks a project when it stalls. I am comfortable travelling and working on site with clients, and I am open to relocating to Paris.

I would welcome the opportunity to discuss how I could contribute to Parallel's deployment team.

Regards,
Prabhavit Gupta
