Dear Hiring Manager,

I am applying for the Mid-level Frontend Engineer role at Relesys.

At FlowSpace, I built product features in Next.js, TypeScript, and React, including mobile-first UI for space listings and the booking flow, where consistent behaviour across device sizes mattered as much as the desktop view. I wrote Playwright tests to keep that UI stable through fast iteration, and built the integrations behind it, wiring the booking flow to OfficeRnD and Nexudus so availability and bookings reflected correctly in our own interface. That mix, frontend work that holds up on a phone and stays coupled to real backend systems, is close to what an employee app for frontline workers needs.

I am drawn to Relesys because the product sits close to users who are not at a desk, which is the mobile-first discipline I have been practising. I bring roughly three years of professional software development, most recently at FlowSpace, focused on frontend quality across the stack.

I am based in Venice, Italy, hold an EU Long Term Residence Permit, and am ready to relocate to Odense. I do not currently hold Danish work authorisation and would need the employer-side permit process, which I am ready to begin.

Regards,
Prabhavit Gupta
