Dear Sisu Group team,

I am applying for the QA Automation Engineer role in Tallinn. You are building an iGaming platform from the ground up with no technical debt, on a stack (TypeScript, Node.js, PostgreSQL, React, Playwright, GitHub, CI/CD) that is the one I test and ship on every day.

At FlowSpace, a London coworking marketplace, I wrote Playwright end-to-end tests for a Next.js and Laravel product while it stayed live through a full stack migration, ran manual edge-case testing before releases, and built an AI listing pipeline whose output is gated by validation checks and human review before anything reaches the database. Earlier, at Clubee, I ran unit testing and QA across a sports-club platform's frontend and API integrations. I am used to agile teams, to writing the test plan together with product and engineering, and to treating flaky tests as bugs rather than noise.

I hold an EU long-term residence permit (Italy), am available immediately, and would relocate to Tallinn for the four-days-in-office rhythm; the Estonian work permit is an employer-side step I am glad to walk through with you. A clear police record is no issue.

Regards,
Prabhavit Gupta
