Dear Serco hiring team,

I am applying for the Software Engineer role supporting your Copernicus Sentinel operations in Rome. Claude Code is my daily development tool, and I have three years of professional experience building Python-based automation, data pipelines and AI-assisted features in production, which lines up closely with the AI-assisted engineering mindset you describe.

At FlowSpace I built and still own an AI listing bot that takes a workspace provider's brochure, in any format, and drafts a structured listing with a human in the loop, using the Claude API, n8n and TypeScript in production, producing more than 900 draft listings. I also built support AI agents that answer customer queries against live platform data with confidence-based escalation to a human, and shipped OfficeRnD and Nexudus API integrations for automated bookings. All of this was built and maintained with Claude Code as my everyday coding agent, the same category of tool this role asks for.

At UltraStrategy I built a CV-parsing pipeline integrated into the platform: a user uploads a CV, the pipeline extracts the data and scores how relevant that person is for specific kinds of roles, the result is shown in the frontend, and a standardised document is generated from it, using Affinda and the Claude API for parsing and generation and n8n and Eden AI for the surrounding automation. That is the closest experience I have to the data ingestion, processing and reporting work behind your EO dashboards and operational tools.

I hold Italian EU long-term resident status, so no sponsorship is needed, and I am based in Venice with the flexibility to work the hybrid schedule from your Rome office. I would welcome the chance to talk through how I would support your Copernicus operations team.

Regards,
Prabhavit Gupta
