Dear Signify Technology team,

I am applying for the Forward Deployed Engineer role on the Agentic AI platform, remote from Italy. I have three years of professional experience building LLM-driven platforms and taking them from a working build to something a real customer runs on their own data.

At UltraStrategy, a French company, I built a CV-parsing pipeline integrated into the platform: a user uploads a CV, the pipeline extracts the data with Affinda and the Claude API, scores how relevant the candidate is for specific role types, delivers the result to the frontend, and generates a standardised CV. I also built the platform that serves different user profiles, so I have carried a feature from pipeline design through to something end users depend on daily.

At FlowSpace, a live workspace marketplace, I built support agents that answer customer queries from live platform data and escalate to a human on low confidence, plus an AI listing bot that drafts full listings from a brochure in any format, with a human in the loop, producing over 900 drafts. I did this while the product stayed live and scaled from 2,000 to over 4,500 users, so I am used to shipping AI features against a moving production target.

My production LLM work has been on the Python automation and orchestration layer, using the Claude API and n8n, rather than infrastructure administration. I have working knowledge of FastAPI and Docker/Kubernetes but have not yet run them in production, and I pick up new stacks fast, shown by eight roles across Europe in three years.

I am authorised to work in Italy without sponsorship and available for occasional client-site travel.

Regards,
Prabhavit Gupta
