Dear Sonar team,

I am applying for the Support Engineer role in Geneva.

At FlowSpace (coworking marketplace, London) I spent two years as the engineer who owned customer issues from first report to fix. Operators and members wrote in with broken bookings, failed integrations and confusing data; I qualified each issue, reproduced it, traced it through the API, database and third-party systems (OfficeRnD, Nexudus, Google, Sendgrid), and either fixed it or wrote the product team a report they could act on. To cut the repeat questions I built RAG support agents that answer from live data and escalate to a person when confidence is low. I also shipped the integrations themselves, so I know the customer side of integration work: identity providers, webhooks, environment differences and the gap between docs and reality.

My development pipeline is the one your customers run: Git and GitHub Actions for CI and code review, Docker, Playwright for test automation, PostgreSQL, deployments on Vercel and Linux. I use Claude Code every day as my primary development tool, so SonarQube's move into verifying AI-generated code is a problem I meet in my own work, and I can talk credibly with customers about agents, IDE integrations and what trusted code means in practice.

I have 2.5 years of professional engineering experience, slightly under the 3 to 5 years you list, but all of it hands-on with customers and pipelines. I am based in Venice, Italy, hold an EU long-term residence permit, and can relocate to Geneva; Switzerland would need an employer-side work permit, which I am used to navigating. English is my working language (C1), Italian basic, and I am available immediately.

A runnable sample of how I build: github.com/prab-gupta/llm-doc-parser. CV attached.

Regards,
Prabhavit Gupta
