Dear StratsLab Hiring Team,

I am writing to apply for the Forward Deployed Engineer role supporting new clients through your system implementation lifecycle in Warsaw. My background is not in trading or finance, but in exactly the discipline this role asks for on the technical side: taking a client's real requirements, translating them into working system configuration, and staying accountable for the result once it is live.

At FlowSpace, I took over a live workspace marketplace and automated its data migration off a legacy stack onto Next.js and Laravel while the product stayed live, mapping the old structure to the new one and choosing the migration path per entity depending on what the data needed. The platform grew from 2,000 to 4,500 plus users through that period, and the work demanded the same client facing precision your implementation lifecycle needs: understanding what a stakeholder actually means, then making the system match it without breaking what already works.

At Clubee, I integrated the Clubee API across the frontend and ran unit testing and quality assurance on new features, work that taught me to treat correctness as non negotiable before something reaches a client, which matters even more around trade risk systems.

I work daily in Python for automation and scripting, and I am comfortable presenting a technical solution to people without a technical background, which your role description asks for directly. I am based in Venice and open to relocating to Warsaw for an office based role.

Regards,
Prabhavit Gupta
