Dear TOPIC hiring team,

I am applying for the Software Development Engineer in Test role. I have three years of professional experience as a full-stack and AI developer across eight European companies, with hands on QA and test automation work close to production code.

At Clubee, a SaaS platform in Luxembourg, I integrated the Clubee API across the frontend and ran unit testing and QA on every new feature, covering the shop, domain integration and federation dashboard tools I built alongside that testing.

At FlowSpace, I use Playwright for testing across a live marketplace that grew from 2,000 to over 4,500 users while I drove the migration to Next.js and Laravel with the product staying live throughout. That work meant keeping test coverage and CI reliable through continuous change, and tracing failures in the pipeline back to root cause rather than only flagging symptoms.

As a further example, at UltraStrategy I built a CV-parsing pipeline integrated into the platform: a user uploads a CV, the pipeline extracts the data with Affinda and the Claude API and scores how relevant the candidate is for specific role types, then generates a standardised CV. Validating that pipeline at every stage and catching failures before they reached users is the same discipline test automation demands.

My core languages are Python and TypeScript, and the range of stacks above shows I pick up new tools and codebases quickly.

I am based in Venice, authorised to work in Italy without sponsorship, and available for the Rome hybrid arrangement.

Regards,
Prabhavit Gupta
