Dear Talent Search Technology team,

I am applying for the Generative AI Engineer role. Upfront: I have three years of professional experience against the mid-senior level this role is pitched at, and my generative AI work is built on large language model APIs and applied NLP pipelines rather than GAN or VAE architectures or deep learning research, so I want to be clear about where my hands-on experience sits before going further.

At UltraStrategy, I built a CV-parsing pipeline integrated into the platform: a user uploads a CV, the pipeline extracts and structures the data with Affinda, scores how relevant that person is for specific roles, and the Claude API generates a standardised Ultra CV from the result, reviewed before it reaches the user. That covers data preprocessing, prompt design, output evaluation and integrating a generative model into a live product, the core loop this role asks for.

At FlowSpace, I built support AI agents that answer customer queries from live platform data and escalate to a person whenever their confidence in an answer is low, so the system fails safe rather than guessing, and an AI listing bot that turns a brochure in any format into a structured, reviewed listing, 900 plus produced so far. Both run in production and both were tuned by testing and correcting real outputs over time.

I have not worked with Microsoft Azure, Dynamics 365 or the Power Platform, and my generative AI grounding is applied rather than research level. I hold Italian EU long-term resident status. I am not currently authorised to work in Poland and would need the applicable employer-side permit or sponsorship process. I am ready to relocate and complete that process.

Regards, Prabhavit Gupta
