Dear kausable team,

I am writing to apply for the Software Engineer, Enablement and Product role. I work across backend, frontend and the delivery layer that turns a platform into something customers and internal teams can actually use, which is the bridge this role is asking for.

At FlowSpace, a workspace marketplace, I took over a live product and automated its migration onto a coded Next.js and Laravel stack, entity by entity, while the platform stayed live and grew from 2,000 to 4,500 plus users. I built the integrations with OfficeRnD and Nexudus for automated bookings, an AI tool that processes data to expand the listings on the platform, and the CRM and GTM automations that support the go to market side. Day to day I worked across the API layer, the frontend and the delivery pipeline with TypeScript, Laravel, Playwright and Git.

At Urlink, I worked as both the developer and the project manager on an AI assisted platform build, translating client requirements directly into working features and automations on Next.js and Supabase, deployed through Netlify and GitHub. That mix of technical delivery and direct stakeholder contact is close to the customer facing and cross functional project work this role calls for.

I am comfortable moving between internal tooling, customer facing features and the infrastructure underneath them, and I already use Claude, Claude Code and similar AI agents daily in my own workflow. I am based in Venice, hold an Italian EU Long Term Residence Permit, and am glad to work the hybrid Heidelberg schedule.

I would welcome the opportunity to discuss how I could contribute to kausable's engineering team.

Regards,
Prabhavit Gupta
