Dear Hiring Manager,

I am applying for the Product Engineer role at Prezly. I have spent the past 2.5 years building product features end to end in PHP/Laravel, React, Next.js, and PostgreSQL at FlowSpace, which maps closely to your stack and the way your team works.

At FlowSpace I owned features from prototype to production. I built an AI data pipeline that ingests documents in any format, extracts structured data using LLM APIs with tool use and structured output, and pushes validated results to the backend after human review. It handles hundreds of sources with completely different formats and replaced a manual process that took hours per source. I also built RAG-backed support agents with confidence scoring and human escalation, API integrations with third-party booking and CRM systems, and internal dashboards. I made product decisions daily: looking at usage data, deciding what to keep, iterating directly with stakeholders, and cutting things that did not work.

What draws me to Prezly is the product-minded culture and the expectation that engineers make decisions, not just implement tickets. I have worked that way for my entire career and I ship best in environments where I can prototype quickly, talk to users, and iterate based on real feedback. I use Claude Code as my primary development tool and I am comfortable working async and remote.

I would welcome the chance to discuss how my experience building full-stack product features and AI-powered tools fits what you are looking for.

Regards,
Prabhavit Gupta
