Dear Hiring Manager,

I am applying for the Full Stack Engineer role on the Connect Team at Riskified. I have spent the past 2.5 years building integrations and AI-powered features end to end at FlowSpace, which maps directly to what this role asks for: designing connectors between external vendor systems and an internal product platform, shipping to production daily, and using AI tooling to move faster.

At FlowSpace I built integration layers against booking systems (OfficeRnD, Nexudus), CRM pipelines (Attio, Amplemarket), and payment flows (Stripe), bridging external vendor data into the platform and iterating on customer feedback. I also built an AI data pipeline that ingests documents in any format, extracts structured data using LLM APIs with agentic orchestration and tool use, and pushes validated results to production after human review. It handles hundreds of sources with completely different formats. I use Claude Code as my primary development tool every day, and I actively use agentic coding tools to ship features faster, which is exactly the workflow your team describes.

What draws me to this role is the combination of integration engineering and AI-driven automation. I have built both sides: reliable connectors that bridge third-party APIs into a product, and LLM-powered workflows that automate data extraction and processing. I am comfortable working across TypeScript, PHP/Laravel, Next.js, and Python, and I care about building integrations that are reliable and well-tested. I am based in Italy with an EU Long Term Residence Permit and available immediately.

Regards,
Prabhavit Gupta
