Motivation letter for Application for AI Engineer – Veghel, Noord-Brabant, Netherlands

Dear Hiring Manager,

I am writing to apply for the AI Engineer role at BAS Group. The detail that made this worth applying to is that you already have three agents deployed against real business processes rather than a pilot deck. Agents that touch CRM, ERP and order processing behave very differently from agents that answer questions, and the interesting work is in the second category.

Over the past three years, I have successfully transformed abstract business requirements into production-ready features across multiple European technology projects spanning different countries and sectors; from a sports management platform in Luxembourg to strategic consultant platforms in France and Spain.

Operating extensively as a freelance AI Solutions Developer, I engineered AI-based data parsing tools using n8n for UltraStrategy, automated complex workflows for Get2Germany, and executed rigorous quality assurance and API integrations for Clubee.

During my tenure at FlowSpace (based in London), I took over an already built system and managed it until its eventual migration to Next.JS and Laravel. Alongside debugging the system, I also partook in GTM automations using their CRM. I engineered AI agents and automated data parsing tools that directly contributed to scaling the platform from 2,000 to over 4,500 active users.

That is the work I have been doing. At FlowSpace I built the support AI agents that ran against real users and the lead capture and enrichment pipeline into the CRM, plus a scraping and parsing tool that increased listings, while the platform went from 2,000 to over 4,500 active users. For UltraStrategy I built a CV-parsing tool in n8n and Eden AI. Across those, the part that took the time was never the prompt; it was routing, deciding what happens when the model returns something the next step cannot use, and making the agent fit a workflow people already had. I have shipped integrations against Office RnD, Nexudus, Clubee, Sendgrid, Google APIs and both the OpenAI and Anthropic APIs, so connecting a model to an operational system is familiar ground.

I extensively leverage AI coding assistants like Claude Code and bolt.new alongside low-code platforms and modern frameworks (TypeScript, Next.JS, Laravel, Supabase) to rapidly test hypotheses and deploy MVP architectures. I am also open to learning new systems and tech stacks; I recently completed a course in Microsoft Copilot and AI agent orchestration.

As a graduate of Ca' Foscari University, I have been living in Venice for 5 years, hold a European Long-Term Residence Permit requiring no visa sponsorship, and have the professional English proficiency required for international collaboration. I am also fully available for short and medium-term business travel as project demands.

Two gaps stated plainly: my orchestration has been n8n and direct API chaining rather than LangGraph, and my infrastructure work has not been AWS-first with Terraform, so Bedrock,

Sagemaker and Terraform would be new. I have Postgres, Supabase and CI/CD experience to build from and I pick up tooling quickly. I would be glad to walk through the FlowSpace agents in detail.

Thank you for your time and consideration.

Sincerely,

Prabhavit Gupta
