Dear Hiring Manager,

I am writing to apply for the Forward Deployed Engineer role at Caplena. I have spent the past two and a half years building exactly the kind of systems this role calls for: customer-facing integrations, data pipelines with Python and SQL, and debugging complex issues end to end across service boundaries.

At FlowSpace, I built an AI data pipeline that ingests documents in any format (PDF, web page, spreadsheet, photo), transforms and validates the data with Python and SQL, and pushes clean results to PostgreSQL after human review. I also built integrations against booking systems (OfficeRnD, Nexudus), CRM platforms (Attio, Amplemarket), and payment flows (Stripe), managing REST APIs, webhooks, OAuth flows, rate limits, and retry logic. A meaningful share of my time was spent working directly with customers and non-technical stakeholders, translating their requirements into working systems and debugging issues through to resolution.

What draws me to Caplena is the mix of engineering and customer work. I have direct experience splitting my time between writing code and working with customers to get them live, which maps closely to the 30-40% development, 30-40% debugging, and 20-30% customer interaction split described in the posting. I work daily with Claude Code as my primary development tool and have hands-on experience with LLM APIs, structured output parsing, and building tools that help non-technical users get value from AI.

I am based in Venice, Italy with a European Long Term Residence Permit and am available immediately.

Regards,
Prabhavit Gupta
