Application: AI Harness Engineer - Agentic & Autonomous Operations, xHeron (Berlin)

Dear xHeron Hiring Team,

I am applying for the AI Harness Engineer role. Your point that a plausible model response is not proof of success matches how I have built LLM systems: the work is in the control layer around the model, checking the result and deciding when a human should step in.

As Lead Developer at FlowSpace I built a Python pipeline that scrapes web content, extracts records with the Claude and OpenAI APIs using structured outputs, routes them through human review and pushes them to an API, adding 900+ listings. I also built a listing sync across 9 operators with fuzzy matching, staged approval and a dry-run mode, so every change was checked before it went live. I integrated the OfficeRnD and Nexudus APIs end to end (OAuth2, webhooks, booking automation), which meant dealing with inconsistent data and changing APIs, and I streamlined customer support with AI agents working against live data. I work with function calling, MCP and agent orchestration, and I know when a deterministic n8n workflow is the better tool.

On the gaps: I have about three years of experience, and I have not built a formal evaluation suite or structured tracing for agents; my verification so far has been human review steps, staged approvals and dry runs. My Python is working level for scripting, automation and AI APIs, not deep backend work. I do not speak German; I work in English (C1).

I am based in Venice, hold a European Long Term Residence Permit (no sponsorship needed in the EU), and am available immediately. I am open to relocating to Berlin. Thank you for considering my application.

Kind regards,
Prabhavit Gupta
